

Explicit relation declaration in the field to target mapping and link to hub mapping (Black = explicit unnamed mapping)

Induced relation participation of a field

Declared tracked relation of effectivity satellites on links

Load operations, created from explicit declarations

Load operations, induced by specific constellations (Star = main/universal, Diamond = Link with explicit relation mappings)

Parent Path = Relation Name in link parent declaration

Arrows annotate the direction of induction

Field Names:

BK = Business Key in hub

C = Content in satellite

DC = Dependend child key in link

Number = Column in the target (Same Number = same column)

T,U,V = Participation of field in relation

Note: Since Hubs must always declare their relations explicitly (else the relation would not exist) the scenarios for satellites on hubs(3000 - 3070) are combinable with all later scenarios

3000

3070

3080  
(22)

3090

Not Recommended,  
since you cant  
distinguish the  
relations later,but  
possible
